SUMMARY

Backend engineer working in Go and TypeScript. Currently a Software Engineer at Optraflow and Technical Lead at SkyBrance while completing a B.Tech in Computer Science. I build APIs, schedulers and distributed systems, and run them on AWS with Docker, Kubernetes and CI/CD.

EXPERIENCE

Software Engineer (Backend), Optraflow Technologies — Jul 2025 – Present

- Built backend execution pipelines and a scheduler for chained API test runs and automated scheduled tasks.
- Built and maintained integrations with third-party tools, making workflows extensible and automated.
- Improved reliability and performance of core services by reworking execution logic, input validation and asynchronous processing.

Technical Lead, SkyBrance Tech Pvt. Ltd. — Dec 2025 – Present

- Led architecture and delivery of platforms built from scratch for 4+ clients, from design through production.
- Owned cloud hosting, deployments and ongoing maintenance of the delivered platforms.
- Set technical direction through code reviews, architecture decisions and delivery planning.

Software Engineer Intern, Reality Loops — Oct 2025 – Jan 2026

- Built backend services for a marketplace where users create, buy and sell AR models of products.
- Designed REST APIs and backend logic for users, assets and transactions.

PROJECTS

gstore — Peer-to-peer distributed file storage in Go — github.com/aniketh3014/gstore

- Built a peer-to-peer file store where every node is both client and server, over a pluggable TCP transport with its own handshake and framing.
- Implemented content-addressable storage (SHA-1 keys sharded into directory paths) and replication by streaming files to all peers after a gob-encoded announce.
- Wrote a replication benchmark that caught a bug where only the first peer received data; after the fix, 100 MB reaches 4 peers in ~0.3 s (~1.3 GB/s aggregate, localhost).

Go microservices — One broker, four transports — github.com/aniketh3014/go-logger-email-microservice

- Built five Go services behind a broker, communicating over REST, net/rpc, gRPC and a RabbitMQ topic exchange; PostgreSQL for auth, MongoDB for logs.
- Deployed the same versioned images with Docker Compose, a Docker Swarm stack, and Kubernetes manifests with an ingress, behind Caddy.
- Tested auth handlers against a mocked repository interface using httptest.

Self-hosted infrastructure — Hardened VPS with zero public ports — aniketghosh.in/projects/self-hosted-infra

- Operate Vaultwarden, Paperless-ngx, Joplin and Netdata on an Ubuntu VPS reachable only through a Tailscale (WireGuard) mesh, hardened with ufw and fail2ban.
- Nginx terminates wildcard TLS issued through DNS-01 challenges, so services get valid certificates without exposing a single port.

SKILLS

Languages and frameworks: Go, TypeScript, JavaScript, SQL, Gin, Node.js, Next.js, React
APIs and messaging: REST, gRPC, RabbitMQ, Redis
Databases and ORMs: PostgreSQL, MongoDB, Prisma, Bun
Cloud: AWS (EC2, S3, ECS, EKS, RDS), Cloudflare
DevOps and infrastructure: Docker, Kubernetes, Docker Swarm, GitHub Actions, Nginx, Caddy, Linux, Tailscale

EDUCATION

B.Tech in Computer Science and Engineering, Siliguri Institute of Technology — Jul 2023 – Jul 2027 (expected)
